Education

Yonsei University — Undergraduate, Mechanical Engineering

Research Interests

I am broadly interested in artificial intelligence, particularly robot learning, control, and simulation, with the long-term vision of building intelligent machines that can perform a wide range of tasks autonomously in the real world.

Selected Projects

PincerCraft — Planning and execution of LLM agents in Minecraft

Independent project · 2026

- Implemented multistep planning, state feedback, action checks, and task-completion verification on Mindcraft, using existing language models and action functions.
- Developed an evaluation system to compare agent configurations on 13 Minecraft tasks.
- Observed false completion in 2 of 52 attempts with the full harness and 23 of 51 with its experimental components removed, using the same language model.

Memex — Shared memory and associative trails for AI agents

Independent project · 2026

- Developed a shared memory system to address context fragmented across multiple agents, inspired by Vannevar Bush's *As We May Think*.
- Implemented workflows for selecting records and connecting them through associative trails that document ideas and decisions.
- Used and refined the system across personal projects over several months to retrieve context from earlier agent sessions.

Additional Experience

TTNK / Jarada — Product design and development · 2026
Contributed to the design and development of a wearable device for posture feedback. The team received an award in the 2026 ROKAF startup competition.

ATClink — Social Engagement Fund (SEF) 2026 · Project participant
Program organized by Yonsei University's Institute for Global Engagement and Empowerment (IGEE). Participate in a team project investigating ways to link medication information across Korea, Vietnam, Nepal, and Uzbekistan.

Honors & Awards

- 공군창업경진대회 — 입상, 2026 · TTNK
- 인천시대학연합창업경진대회 — 우수상, 2024
- 연세대학교창업지원단 — 입상, 2024

Technical Experience & Independent Study

Implementation of reinforcement-learning algorithms in Python; development and evaluation of LLM agent systems; AI product design.

Independent study: UC Berkeley CS285: Deep Reinforcement Learning — 2023 lecture series and public course materials.
