Education

Yonsei University — Undergraduate, Mechanical Engineering

Research Interests

Robot learning; autonomous agents for open-world, long-horizon tasks; memory and knowledge sharing across agents.

Selected Projects

PincerCraft — Harness engineering for autonomous Minecraft agents

Independent project · 2026

- Developed a harness on Mindcraft combining multistep planning, refreshed world-state context, action checks, and task-completion verification around an LLM.
- Reused existing action functions while designing orchestration, inventory and progress feedback, and evaluation.
- Evaluated configurations on a fixed 13-task benchmark. False completion occurred in 2/52 full-harness attempts versus 23/51 without its experimental components, with the same model.

Memex — Shared memory and associative trails for AI agents

Independent project · 2026

- Built a shared knowledge system to address fragmented long-term context across personal and coding agents, inspired by Vannevar Bush's *As We May Think*.
- Designed record-selection and associative-trail workflows to preserve findings and the reasoning connecting them.
- Used and iterated on the system across ongoing projects, supporting retrieval of prior context across agent sessions.

Additional Experience

SEF 2026 / ATClink — Project participant · Ongoing
Participate in a team project exploring medication-information correspondence across Korea, Vietnam, Nepal, and Uzbekistan.

Honors & Awards

- 공군창업경진대회 — 입상, 2026
- 인천시대학연합창업경진대회 — 우수상, 2024
- 연세대학교창업지원단 — 입상, 2024

Technical Experience & Independent Study

Python implementation of reinforcement-learning algorithms; LLM-agent orchestration; evaluation design; AI product design.

Independent study: UC Berkeley CS285: Deep Reinforcement Learning — 2023 lecture series and public course materials.
